

Week 2 on Building Applications in PHP

In this next assignment, you will build a simple valid HTML5 page that demonstrates a number of tags. Your page will be well-formed HTML5, and indicate that it is in the UTF-8 character set:

Ex.

```
<!DOCTYPE html>

<html>
  <head>
    <title>Jane Instructor</title>
    <meta charset="UTF-8">
  </head>
  <body>
    ...
  </body>
</html>
```

It must be validated in the HTML Checker

<https://validator.w3.org/nu/>

The **title** tag must contain your name or the string indicated by the autograder.

```
<title>... Amber Clarisse M. Cubacub aac266 ... </title>
<meta charset = "UTF-8">
```

You must have at least one example of each of the following tags: **span**, **p**, **div**, **h1**, and **ul**

Span: `I am an incoming college student`

Paragraph: `<p>My hobbies are reading and writing novels</p>`

Div:

```
<div style="color:orange">
```

```
<h1>I am a junior frontend developer and a web designer</h1>
```

```
</div>
```

H1: `<h1>I am a junior frontend developer and a web designer</h1>`

Ul:

```
<ul>
```

```
  <li>Reading Novels</li>
```

```
  <li>Writing Novels</li>
```

```
<li>Coding</li>
</ul>
```

You must have three **a** tags and three **li** tags.

A tag:

```
<a href="https://github.com/">Github</a>
<a href="https://www.youtube.com/">Youtube</a>
<a href="https://www.instagram.com/">instagram</a>
```

Li:

```
<li>Reading Novels</li>
<li>Writing Novels</li>
<li>Coding</li>
```

You must have some bold text in the document and some italics text in the document but you cannot use the **b** or **i** tags. The autograder will only grade HTML, and ignore any CSS.

```
<strong>Hello, Welcome to my Page</strong>
<em>My life as a Web Developer</em>
```

Voila!
